

**Jaipur Engineering College & Research Centre**

**Unit test-1**

**Subject: Microprocessor and Interface (4IT1A)**

**Semesters & Section-4IT1 (A+B)**

**UNIT 1 & 2 - THE 8085 MICROPROCESSORS**

1. What is Microprocessor? Give the power supply & clock frequency of 8085

.....  
.....  
.....

2. What are the functions of an accumulator?

.....  
.....

3. Mention the purpose of SID and SOD lines

.....  
.....

4. What is the function of IO/M signal in the 8085?

.....  
.....

5. What is an Opcode and Operand?

.....  
.....

6. List out the five categories of the 8085 instructions. Give examples of the instructions for each group?

.....  
.....  
.....

7. What is a microcomputer?

.....  
.....

8. How many interrupts does 8085 have, mention them.

.....  
.....  
.....

9. Define instruction cycle, machine cycle and T-state

.....  
.....  
.....

10. What is an instruction?

.....  
.....  
.....

11. What is the use of ALE?

12. How many machine cycles does 8085 have, mention them

13. Explain the signals HOLD, READY and SID

14. Explain LDA, STA and DAD instructions

15. Explain the different instruction formats with examples

16. What is the use of addressing modes, mention the different types?

17. Give the register organization of 8085.

18. What is Microprocessor, Microcontroller and Microcomputer?

19. Define Flags

20. Define the terms T-state, instruction cycle and machine cycle?

# How To Write An Assembly language Program 29/8/2022

Algorithm:- Before writing the program the programmer must understand the problem for which the program is to be written. Then Algorithm can be written.

Algorithm is the step-wise definition written in simple and precise language, in which the large problem is broken into unbreakable steps, so that each step can be easily converted into programming statement.

For Example if we want to WAP to add two number. The Algorithm is written as below

Algorithm to add two 8bit Number

- 1) Read first Number
- 2) Read second Number
- 3) Add Numbers and save the sum
- 4) Display result.
  - 1)  $A \leftarrow \text{first No.}$
  - 2)  $B \leftarrow \text{Second No.}$
  - 3)  $A \leftarrow A+B$
  - 4) Display  $\text{out} \leftarrow A (\text{SUM})$

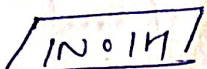

Flow chart - Flow chart is the graphical representation of an Algorithm, which shows the flow of program execution.

- 1) Terminal - Oval symbol shown below is used to indicate terminal (start/end) of the program. Words like START/BEGIN, STOP/END are written in Terminal symbol.

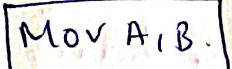

START

ii) Input/output :-

The Parallelogram symbol is used to Represent the I/O process as shown below

 — INPUT/OUTPUT SYMBOL

iii) Process - The Rectangle symbol is used to Represent the process operation.

 — Process symbol

(iv) Decision Making

The rhombus / diamond symbol is used to Represent the decision making process as shown below:

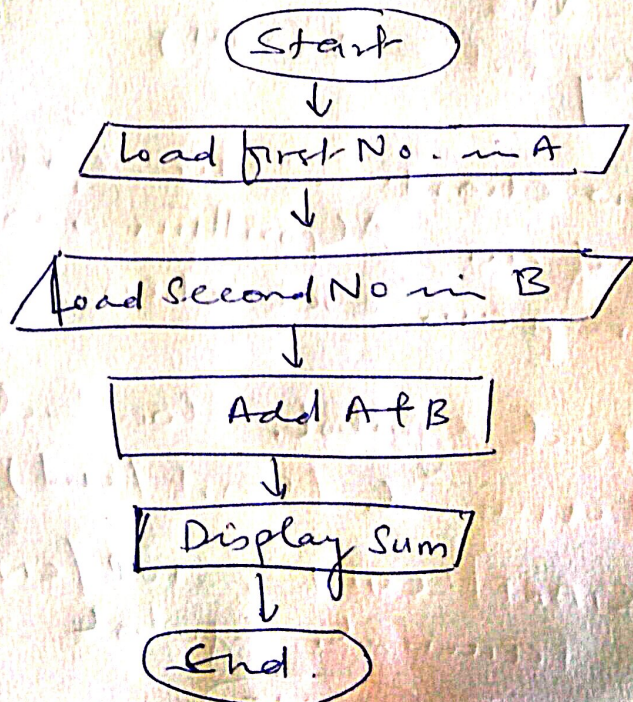

Decision Making Symbol

(v) Flow Direction :-

Flow directions are Represented by arrows.

For Example - Flow chart of Adding two numbers  
may be drawn as shown below.

# Writing and Executing an Assembly Machine Language Program

## 1) Program to add Two 8-bit Numbers

AIM:- WAP to add two 8-bit Numbers stored in Register A and Register B. Display the Result at OP Address 2050H.

### Solution

Memory Address	Mnemonics	Hex Code	Remarks.
2000H 2001H	MVI A, 20H	3EH 20H	Load 20H in Register A
2002H 2003H	MVI B, 30H	06H 30H	Load 30H in Register B
2004H	ADDB	80H	Add Content of Reg B with A and store the result in A
2005H 2006H 2007H	STA 2050H	32H 50H 20H	Display the Content of A in Memory location 2050H.
2008H	HLT	76H	STOP the program

② WAP to Add 16 bits Number 2570H and 32AH using DAD Instruction. Store the result in 16 memory.

Ans:- DAD Instruction is 8085, which adds the content of any Register pair with the content of HC pair and Result stored in memory location 3050H and 3051H.

Memory Address	Mnemonics	Hex Code	Remarks
2000H 2001H 2002H	LXI B, 257DH	01H 70H 25H	Load first Number in BC Register Pair
2003H 2004H 2005H	LXI H, 32A1H	02H A1H 32H	Load second Number in HL Register pair
2006H	DAD B	09H	Add the Content of BC with HL. Result stored HL
2007H	MOV A, H	7CH	Copy high order byte of the Result into A
2008H 2009H 200AH	STA 3050H	32H 50H 30H	Store high order byte in Memory location 3050H
200BH	MOV A, L	7DH	Copy lower order byte of HL Result into A
200CH 200DH 200EH	STA 3051H	32H 51H 30H	Store lower order byte in Memory location 3051H.
200FH	HLT	76H	Stop the Program

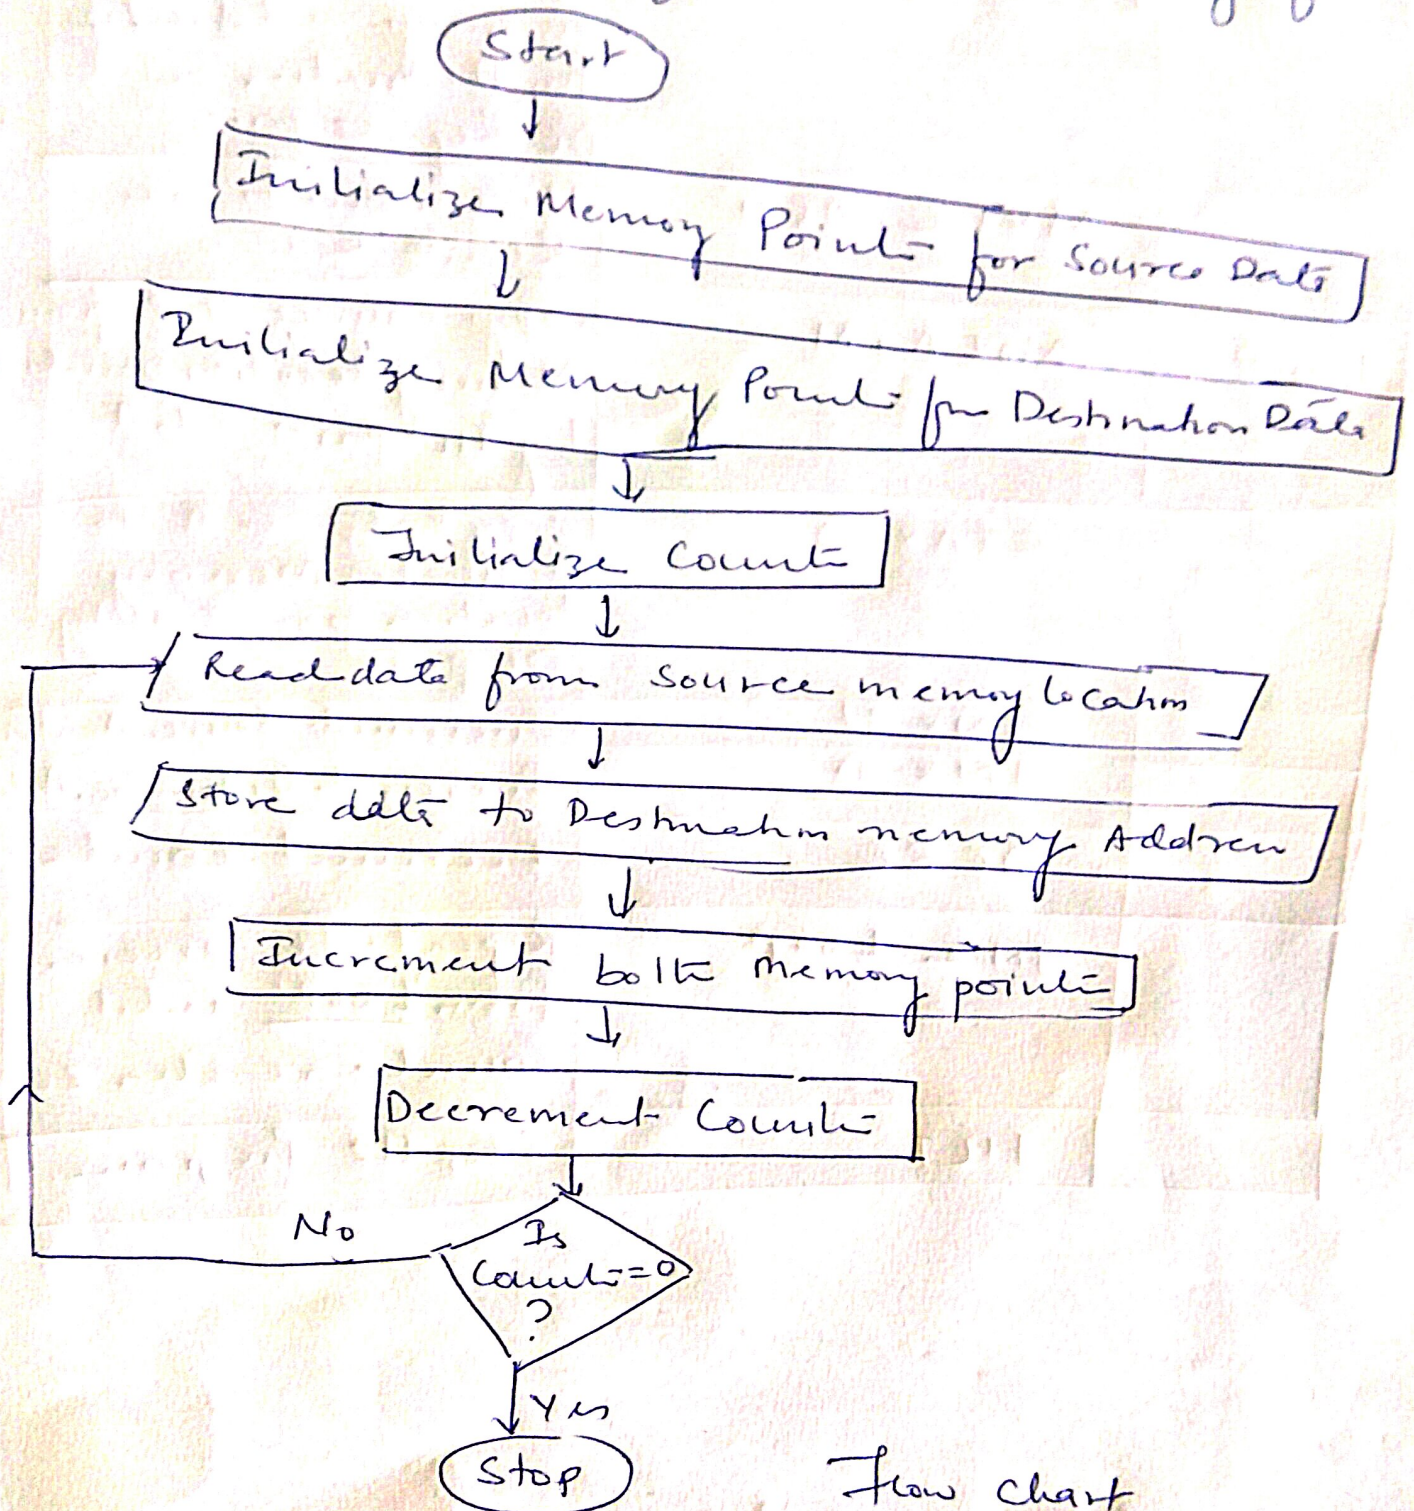

Result - BC - 257DH  
 HL - 32A1H

HL - 5812H

3. Copy Data bytes from one memory block to another memory block.

Question WAP to copy a block of data bytes from one memory location from 2051H to another memory location starting from 3051H.

Flow chart

Label	Mnemonic	Remarks
	LXI H, 205H	Initialize Memory pointer with Address of HL when the Data
	LXI D, 305H	store the starting memory address of the Destination in DE Register pair
	MVI C, 05H	store count in Register C.
LOOP ;	MOV A, M	Copy source Data from Memory location pointed by HL pair into A
	STAX D	Copy Data in A to Destination Memory location pointed by DE pair
	INX H	Increment Source Address
	INX D	Increment Destination Address
	DCRC	Decrement Count
	JNZ LOOP	Repeat the process from 'LOOP' until Count reaches zero
	HLT	Stop the Program.

## Q.2 DEBUGGING A PROGRAM :-

Debugging a program is similar to troubleshooting HW. In program, the result binary, either it works or it does not work.

Two type of Debugging are :-

- 1) Static Debugging - To visual inspection of ckt board; it is done by a pencil paper check of a flow chart and m/c code.
- 2) Dynamic Debugging - observing the execution of each instruction (the single step technique) or of a group of instructions (the break point technique).

Debugging a M/c code :-

The m/c code will have errors just like ckt board.

- 1) selecting a wrong code.
- 2) Forgetting the second or third byte of an instr<sup>n</sup>.
- 3) specifying the wrong jump location.
- 4) Not reversing the order of high & low byte in JMP Instr<sup>n</sup>.
- 5) Writing memory address in decimal, thus specifying wrong jump location.

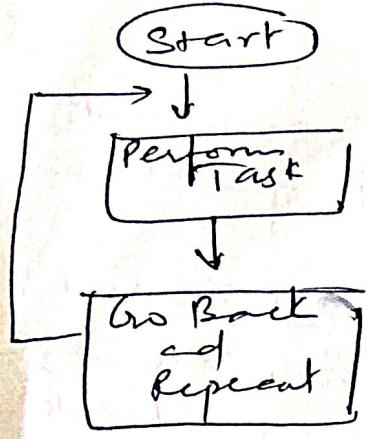

## PROGRAMMING TECHNIQUES :-

### LOOPING, COUNTING AND INDEXING :-

PT used to instruct the MP to repeat task is called looping. A loop is set by MP to change the sequence of execution and perform task again. This process by using JMP Instr<sup>n</sup>.

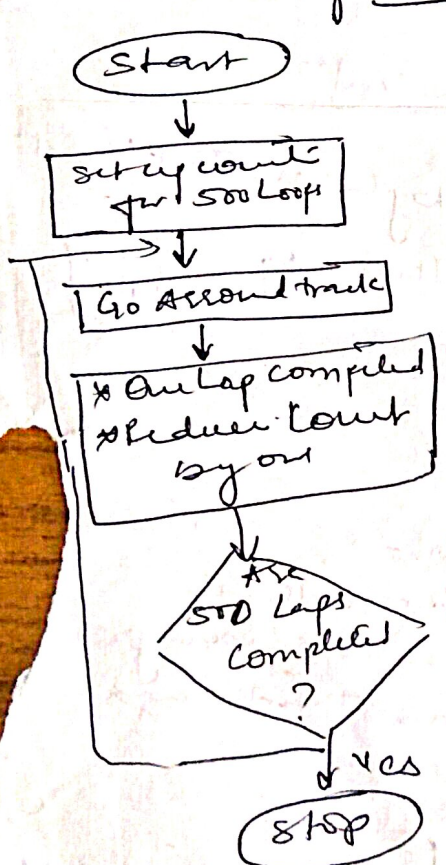

- \* Loop are classified into two groups.
- 1) conditional loop - Repeat a task until certain data condition are met.
  - 2) continuous loop - Repeat a task continuously.

1) Continuous Loop - A CL set up by using the unconditional JMP Instr.

A program with a CL does not stop repeating the task until the system is reset. Ex - Count or a continuous monitor system.

2) Conditional Loop - CL is set by conditional JMP Instr. Check flags (zero, carry etc), and repeat as specified task if condition is satisfied. Then loop usually counts and indexing.

Laps in a Car Race

Load App count in Reg

either Dec or INC the count

Conditional JUMP

End of count is indicated by a flag.

Block of data transfer Example  
XX00 to YY00

## DEBUGGING A PROGRAM:-

Debugging a program is similar to troubleshooting. The debugging program can be divided into 2 parts = static debugging.  
= Dynamic debugging.

Static debugging:- is similar to visual inspection of a ckt board. It is done by a paper and pencil. Check of flowchart and machine code.

Dynamic Debugging - involves observing the D/P, or register content, following the execution of each Inst<sup>n</sup> or of a group of Inst<sup>n</sup>.

The following errors are common are:-

- 1) Selecting a wrong code.
- 2) Forgetting the second or third byte of an Instruction.
- 3) Specifying the wrong jump location.
- 4) Not reversing the order of high and low byte in Jump Instruction.
- 5) Writing memory addresses in decimal thus specifying wrong jump location.
